Regulatory Reporting Pack – Wooden Poles

Guidance Document

General Information

Background

Every year Scottish Power submits a Regulatory Reporting Pack to Ofgem, detailing information including volume delivery, expenditure and outputs. After the first 2 years of DPCR5 (April 2010 to March 2012) Ofgem calculated that Scottish Power were well behind on delivering their DPCR5 outputs in both SP Manweb and SP Distribution. This was in contrast to our internal view of outputs, where, although we had calculated we were behind on outputs, we were in a healthier position than Ofgem had concluded. Therefore, Scottish Power started a review of all volume delivery information across SP Manweb and SP Distribution in order to understand the discrepancies between our view and Ofgem’s view. This document will look at the wooden poles submissions for SP Manweb and SP Distribution and discuss the discrepancies and possible options for improving the outputs position associated with wooden poles.

Introduction

This document will be split into three sections. This first section will cover general information about our RRP submissions. The second and third will cover SP Distribution and SP Manweb respectively. In these sections, I will explain the current outputs positions and discuss how we can improve this. Furthermore, I will provide the possible implications of the improved positions and how best to detail this information in the 2012/13 Regulatory Reporting Pack.

Reporting Systems

For wooden poles, SP’s master system is ESRI. However, this information is mapped to SAP in order to provide maintenance and inspection programmes, as well as recording pole condition information and defects. For the 2010/11 RRP submission, SP used the pole movements from SAP. For the 2011/12 RRP submission and subsequent RRP, ESRI will be used to provide the pole movements information. Due to discrepancies between ESRI and SAP, it has proven difficult to compare the current ESRI data set to our 2010/11 RRP submission. This will be explained in more detail within each licence section.

Health Index

For each pole addition and disposal, it is assigned a Health Index (HI0-5 with HI1 New and HI5 End of Life). For RRP 2010/11 and 2011/12, this was assigned by using the age of the pole and any existing Rotten Pole anomaly in SAP as shown in the diagram below.

Figure 1 - Health Index Calculation RRP 2010-12

HI0 or HI Unknown for disposals in RRP purposes is divided across HI1-HI4 in the same proportion as the existing profile for each specific Asset Activity and voltage level. For example:

Asset Activity	HI0	HI1	HI2	HI3	HI4	HI5	Total
Existing Profile	750	0	50	200	500	750	2250
New Profile	0	0	100	400	1000	750	2250

Figure 2 – Disposal HI Re-profile RRP 2010-12

HI0 for additions are assumed to be HI1 (New Assets).

For the 2012/13 RRP submission, we have changed our approach to how the HI is calculated for our poles. The new HI methodology of the poles involves assigning a Health Index (HI0-5 with HI1 New and HI5 End of Life) as illustrated in the diagram on the following page. From 2012, poles were assigned a condition based HI1-5 during inspections. However, until we have been round the whole SP network, we will still need to utilise any existing rotten pole anomalies, or the age of the pole to determine the HI. We have also changed the pole age banding to reflect a more accurate HI profile for wooden poles.

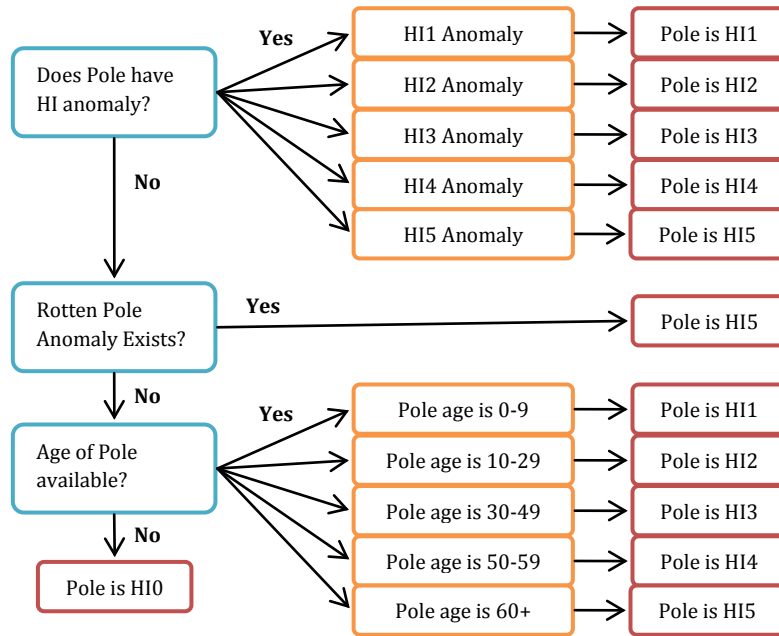

Figure 3 - Health Index Calculation – New Methodology

Furthermore, if a pole has been disposed and was associated with an ESQCR non-compliance issue, it is assigned a HI5.

HI0 or HI Unknown for disposals in RRP purposes is divided across HI1-HI5 in the same proportion as the existing profile of disposals for each HI reporting activity and voltage level. For example:

Asset Activity	HI0	HI1	HI2	HI3	HI4	HI5	Total
Existing Profile	750	0	50	200	500	750	2250
New Profile	0	0	75	300	750	1125	2250

Figure 4 – Disposal HI Re-profile New Methodology

HI0 for additions are assumed to be HI1 (New Assets).

See document ASSET-01-019 for more information on Asset Health, Criticality & Outputs Methodology used in SP Energy Networks.

Asset Activity

Each pole addition and disposal is assigned an Asset Activity – this is the reason behind the pole movement, for example this may be faults or customer connections. For the HI outputs, OFGEM only look as Asset Replacement movements, however, other movements are still important as it affects our overall HI profile of our network. This information is provided to Data Management as part of the data sheets that are returned when the work has been carried out.

Objective

This document will explain our previous RRP submissions and how we plan to improve our HI output position. This will primarily be based on pole information that has not been recorded on our IT system, ESRI, but can be used to justify the Health Index of a pole and which Asset Activity it should be classified as. To do this, a database for SP Distribution and SP Manweb has been created, which allows us to analyse all the sources of information and produce our HI outputs position.

SP Distribution

RRP Submissions

RRP 2010/11 Submission

The 2010/11 submission was based on an extract from SAP, where the master system ESRI maps information to the SAP system. This allows us to use SAP for maintenance and inspection programming. However, there have been issues with this mapping and it was not until 2012 when this issue was addressed and processes put in place to correct this. This means that mapping the 2010/11 submission to the current live ESRI view is very difficult. Furthermore, the asset activity was lost in SAP and therefore the original data set did not show many disposals against asset replacement so an adjustment was made to the submission as shown below. This is detailed in the narrative for the 2010/11 submission.

33kV Poles						
	Data from IT Reports			Proposed

Total	1256	2154	-898	1256	2154	-898

Figure 5 – 2010/11 SPD RRP Adjustments

As this was a high level adjustment, when we take a single pole from the 2010/11 submission, it is difficult to determine what category it was reported as in the submission. For example the table above shows 2058 LV poles were assigned as Asset Activity of Unknown; however, over a thousand of them have been reported as Asset Replacement.

All the poles in the 2010/11 submission file are located in the live ESRI file except 539 poles that appear in SAP but not in ESRI. These were all reported as Data Cleanse in the 2010/11 RRP as they were pre DPCR5 disposals bulk loaded into SAP. The 2010/11 detailed file used in the Poles Database has been updated to mirror the above adjustments, as well as the HI outputs position submitted to OGFEM. The outputs position after the first year of DPCR5 is shown on the following page. This is based on the accumulative HI position for each value (additions and disposals), reported against Asset Replacement only. How the HI0's were spread is explained in the first section. The % outputs shown are for the SP Distribution total across all HI output categories. In SPD, Poles makes up 22.33% of the total DPCR5 outputs. Therefore the 1.37% shown is comparable to a straight line 5 year delivery of 4.5% per annum. Thus this indicates around 1/3 of outputs delivered in 2010/11 against D5 settlement for wooden poles.

RRP Submission 2010/11 *						
HI						
	1	2	3	4	5	% Ouputs
LV	1088	-73	-531	-493	-3	0.76%
HV	858	-146	-538	-173	-1	0.53%
EHV	101	-6	-95	0	0	0.09%
						1.37%
* Data Set from SAP						

Figure 6 – 2010/11 SPD RRP HI Outputs

RRP 2011/12 Submission

The 2011/12 submission was based on an extract from ESRI. Therefore it was easy to map the submission to the current live ESRI report. Since the 11/12 submission, there have been some minor adjustments to number of poles and asset activity. The table below shows the HI outputs table that was submitted to OFGEM.

RRP Submission 2011/12						
HI						
	1	2	3	4	5	% Ouputs
LV	1053	0	-542	-485	0	0.74%
HV	1179	-116	-503	-311	0	0.67%
EHV	478	-4	-503	0	0	0.44%
						1.86%

Figure 7 – 2011/12 SPD RRP HI Outputs

This indicates that we reported no HI5 pole disposals as part of the 2011/12 submission. In fact when we look at the current ESRI data set for 2011/12 (shown below) we can see that the live ESRI data shows over 750 HI5 poles were disposed in 2011/12. Therefore there was an error in the HI tables for the 2011/12 submission.

New Profile 2011/12						
HI						
	1	2	3	4	5	% Ouputs
LV	1118	-36	-230	-251	-574	1.23%
HV	1198	-115	-379	-286	-172	0.88%
EHV	479	-4	-492	0	-12	0.47%
						2.58%

Figure 8 – 2011/12 Re-run HI Outputs

This will be taken into consideration when discussing the 2012/13 RRP submission later on in this document.

As part of this exercise, it also became evident that the data sets run from ESRI were only looking at the last instance of a pole movement. This means that if a pole had been added and disposed of in the same regulatory year then it would only appear as a disposal and would not have been included in the addition count. This has now been corrected but means we may have understated our position in 2010/11 and 2011/12 RRP submissions. Any “missed” additions or disposals however will be included in the 2012/13 submission so we will be credited accordingly.

RRP 2012/13

Asset Movements File

The starting point for the RRP submission is the IT extract from ESRI showing all the pole movements. The current report shows all movements in DPCR5 from April 2010 to March 2013. Before this file is input to the poles database, some manual adjustments are made to the health index of some poles as described in the next section. Furthermore, a script in excel is used to carry out the X-Y matching, also described in the following section.

Non HI1 Additions

Any time a new pole is added to our system it should be a HI1 as we do not re-use poles. The only exception to this should be when we discover a pole which may have been there for a long time and is, for example a HI3, but has never been loaded into ESRI. In this case, a HI3 addition should be seen against an Asset Activity of Data Cleanse. For all the Non HI1's where the HI banding had been determined from the HI anomaly code, these poles were checked in SAP to see when the anomaly code was added to the pole. If it was added after the Addition date of the pole, it was assumed the HI anomaly code referred to the previous pole and therefore the HI of the addition was set to HI1 (or corresponding age based HI if the pole had an impregnated date). Similarly, if a matching disposal was found, the HI of the disposal was set to the HI anomaly code of the addition (if the disposal's current HI was at a lower level to the matching addition HI).

Non HI5 Disposals

Generally, our pole replacement strategy for Asset Replacement is to only replace a pole when it is end of life HI5 (rebuilt are most common exception), so for all non HI5 Disposals, a check was made to see when the HI anomaly code was placed versus the addition date of a matching addition pole. If the anomaly code was placed after the new pole was added, it was assumed that the anomaly code was placed in error on the old pole. The HI for the disposal was then set to a corresponding HI based on the rotten pole anomaly code or age of the pole (see earlier in document for calculation of HI).

X-Y Matching

This is where we use the XY co-ordinates of an addition pole and match it to within 3m of a disposal. This allows us to adjust the Asset Activity to make the data more accurate. For this, we only adjust the disposal category if the Asset Activity of the addition is "Asset Replacement" and the disposal category is either "Other", "Data Cleanse" or "Unknown". For example, if the pole addition was against Asset Replacement and the matching pole disposal was against Connections, we would not change this information. However if the addition was "Asset Replacement" and the disposal was "Unknown", then it would be safe to say the pole change was part of an Asset Replacement job so the disposal should also be a Asset Replacement category. Furthermore, where an additional pole had a matching disposal, the HI of the addition was set to HI1 if it was not already, as any pole replacement carried out by SP will be a brand new pole.

Figure 9 - X-Y Matching Diagram

Sources of Information

The following pages describe sources of information that can be used to justify a revised HI position for disposed wooden poles. These sources will then be combined to provide a new HI position for SP Distribution.

Category 1-5 Low Ground Clearances

As part of SP's work on removing all Low Ground Clearances on our network, any pole change associated with an LGC is assigned HI5. Although this is not picked up in our ESRI system, we have the original list of circa 55,000 LGC's in SP Distribution that is from our SAP system and is by ENID number (this is the unique reference number for an asset used in both SAP and ESRI). We can then compare this list with our live ESRI data set and adjust the HI for any matching pole disposal to a HI5. This does not affect the Asset Activity code for the disposal.

HI Reporting 2013

In January 2013, SP programme managers began recording additions and disposals manually along with any HI information. This would allow SP to monitor what programme managers were delivering and how it compared to our IT systems. This could also be used to justify any HI changes that are not recorded in the IT system. For example, if a HI5 pole

was disposed but this information was not identified in ESRI before the disposal, these HI reporting sheets can be used to adjust the pole disposal to HI5 before submitting to OFGEM as part of the 2012/13 RRP submission. This method can change both the Asset Activity (to Asset Replacement only) and HI information of a pole.

AIS 24K

This is a list of circa 24,000 poles (both SPD and SPM) of rotten poles that were not transferred into our SAP defect reporting system when we moved from AIS to SAP. An exercise has now been carried out to transfer over any defects on existing poles. This was completed in April 2013 therefore this file is used to match any disposal in the first 3 years of DPCR5 and set the HI to HI5.

Contractor Information

CIET

When CIET survey any SP job, all the pole information is put into a database. This database is then used to help build up a target price for each project. In the poles database, this survey database is matched to any pole disposal in ESRI. Where a match is found the Asset Activity of the pole is set to “Asset Replacement” and the HI of the pole disposal is determined using the information from the CIET survey. This will be either the condition of the pole, age of the pole or any comments made during the patrol. For example, if the pole was surveyed as “Decayed”, this would be assigned a HI5. Furthermore, if the patrol comments stated that the Depth Mark was high, then this would also be assigned a HI5. The HI based on the age of the pole follows the new HI methodology mentioned earlier in this paper. The comprehensive table of assigning HI5 values is shown in the SPD Poles Database. Where the pole can be designated a HI based on age, condition and patrol comments, the highest HI is assigned to the pole. The CIET poles database covers poles at LV, HV and EHV. Also, there are an additional 5 projects that were not part of the CIET database. The survey information for these has been added to the SP Poles Database.

ENS

Similar to CIET, ENS uses an access database to store all the pole survey information for both HV and EHV poles, which is then used to produce target prices for each OHL project. In the SPD Poles Database, this survey database is used to match any pole disposal in ESRI. Where a match is found the Asset Activity of the pole is set to “Asset Replacement” and the HI of the pole is determined using the information from the ENS survey database. This will be based on the highest HI value from the condition of the pole, age of the pole, patrol comments or where the pole has a depth mark of $\geq 1.7\text{m}$ (these poles should have been changed and will be assigned as HI5). The HI based on the age of the pole follows the new HI methodology mentioned earlier in this paper. The comprehensive table of assigning HI5 values is shown in the SPD Poles Database. Also, there are an additional 5 projects that were not part of the ENS database. The survey information for these has been added to the SP Poles Database.

ENS LV work was surveyed and the paper copy of the OHL maps were updated manually onsite. This map was then converted to a target price for the work but no pole condition information or reason for pole changes were transferred to the target price document. This would mean that a manual exercise would be required to go through the paper copies to extract pole condition information for all the LV pole changes. This has not been carried out.

Powerteam

All of Powerteams HV and EHV projects had CBA's carried out prior to the work on site. These CBA's were compiled and pole information extracted for inputting to the database. Where a pole change was to take place, the “Reason” identified in the CBA and the age of the poles was used to determine the HI of the disposed pole. The highest HI between reason and age was then assigned to each pole change.

For Powerteams LV work, there was no electronic format suitable to quickly gather pole information. This is because for each LV job, the surveyor would highlight on the pdf maps the work required and the condition of each pole change. Therefore a manual exercise was carried out to go through all the LV pdf maps and extract the pole condition information into excel to allow this to be added to the SPD Poles Database and match pole disposals to our ESRI dataset. Each description for the pole change was then used to assign a HI to the disposal. For example “Rotten” was assigned a HI5.

Freedom

For LV pole information, the 2011 data is from the weekly tracker. This file identifies all the ENIDs where Freedom has changed any poles that were either rotten or part of a Low Ground Clearance solution. Either reason is assigned a HI5. The 2012 data at present is a combination of the 2012 weekly tracker (only ran until July 2012) and the completion certificates from Freedom's 2012 LV work. The completion certificates were used to populate the weekly tracker so contain the same information – ENID numbers of pole changes due to rotten or low ground clearance issues. These will be assigned HI5 if a matching disposal is found in the ESRI record set and the Asset Activity set to “Asset Replacement”.

For HV information, Freedom provided the CBA's for the 2012 HV and EHV work, with the exception of circuits that had CBA's prior to handing over to Freedom. The information from these CBA's was extracted and linked to the ESRI live dataset. Where a matching disposal was found and the CBA identified it as a pole replacement, this pole was assigned to HI5 and "Asset Replacement". If the pole was not identified to be replaced in the CBA but was disposed in the ESRI data set, then the age of the pole was used to determine the HI.

PoleTech

Some survey work carried out by Poletech in 2009 and 2010 was never updated in our corporate IT system. Therefore some of these surveys were used to update the HI of pole disposals based on the condition based information in these surveys. For example, if the survey identified the pole as decayed, it would be set to HI5.

SPD Poles Database

In order to analyse all the data from the different sources, all the information was placed in an Access database. This allowed us to quickly look at scenarios for applying rules to different data sources and also allows us to quickly update any sources of information, including updates to the live ESRI data set. In the database there are a range of options that can be used to provide different possible HI output positions. Once a new HI position has been created in the database, this information is pasted into an Excel file to carry out some final checks and balancing. The Excel file then translates the tables into a % HI position for SPD Health Index.

There are a number of reports / checks that can be run in the database but the main menu is where the user can select which data set and rules to apply to the original live ESRI data set to produce a new revised data set and hence a new HI outputs position. The picture on the following page shows the main menu and different options available.

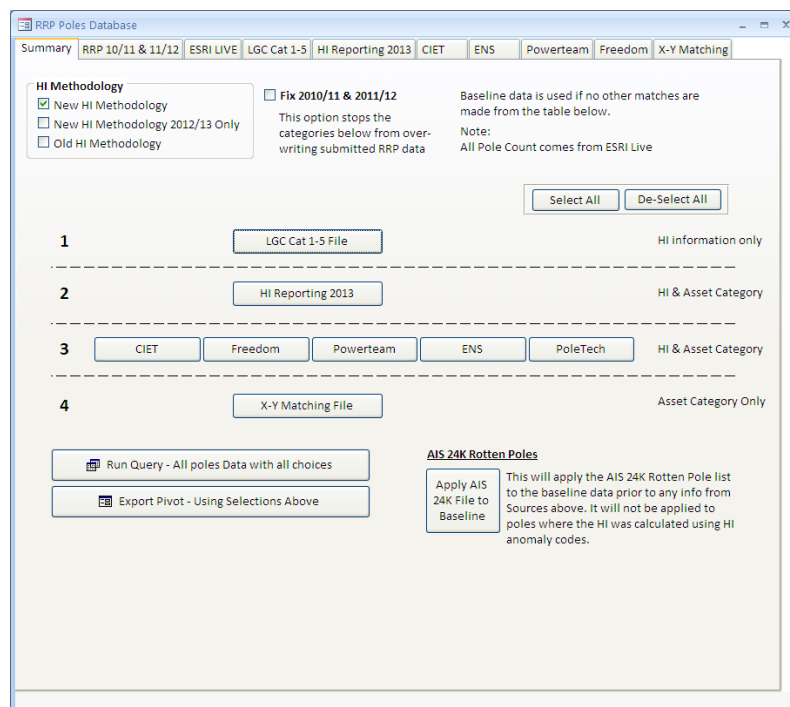

Figure 10 – SPD Poles Database Main Menu

This allows different sources of data to be used, different HI methodology (described at the beginning of this document), and different possible scenarios for completing the 2012/13 RRP.

New HI Outputs Position

The database provides a new HI outputs position by combining all the information from the different sources, applying changes to HI information and Asset Activity information to each pole addition and disposal where appropriate.

Figure 11 - SPD Poles Database Process

The diagram shown on the following page illustrates how all the different information is linked and the priorities used when applying data sets to the source data set. Different options can be selected for how the previously submitted RRP data is treated but for example, if we selected to ignore previously submitted data and apply the new HI methodology for a pole, then the pole disposal would first be checked if it is in the Cat 1-5 LGC file (Level 1). If it is, the HI of the pole would be set to HI5. We would then move on to Level 2, the HI Reporting 2013 file. If the pole is matched, the HI and Asset Activity would be set based on this file, but the HI would only use the Level 2 HI if it did not match at Level 1. Then the pole is checked at Level 3, the contractor information. If matched at this level, the pole HI and Asset Activity would be set based on the contractor info. Similar, any matches at a higher level would prevent a match from a lower level. The pole is then checked at Level 4, XY matching. This will not affect the HI of the pole but would re-class the pole as “Asset Replacement” where matched. For more information on how the different sources operate, see page 6.

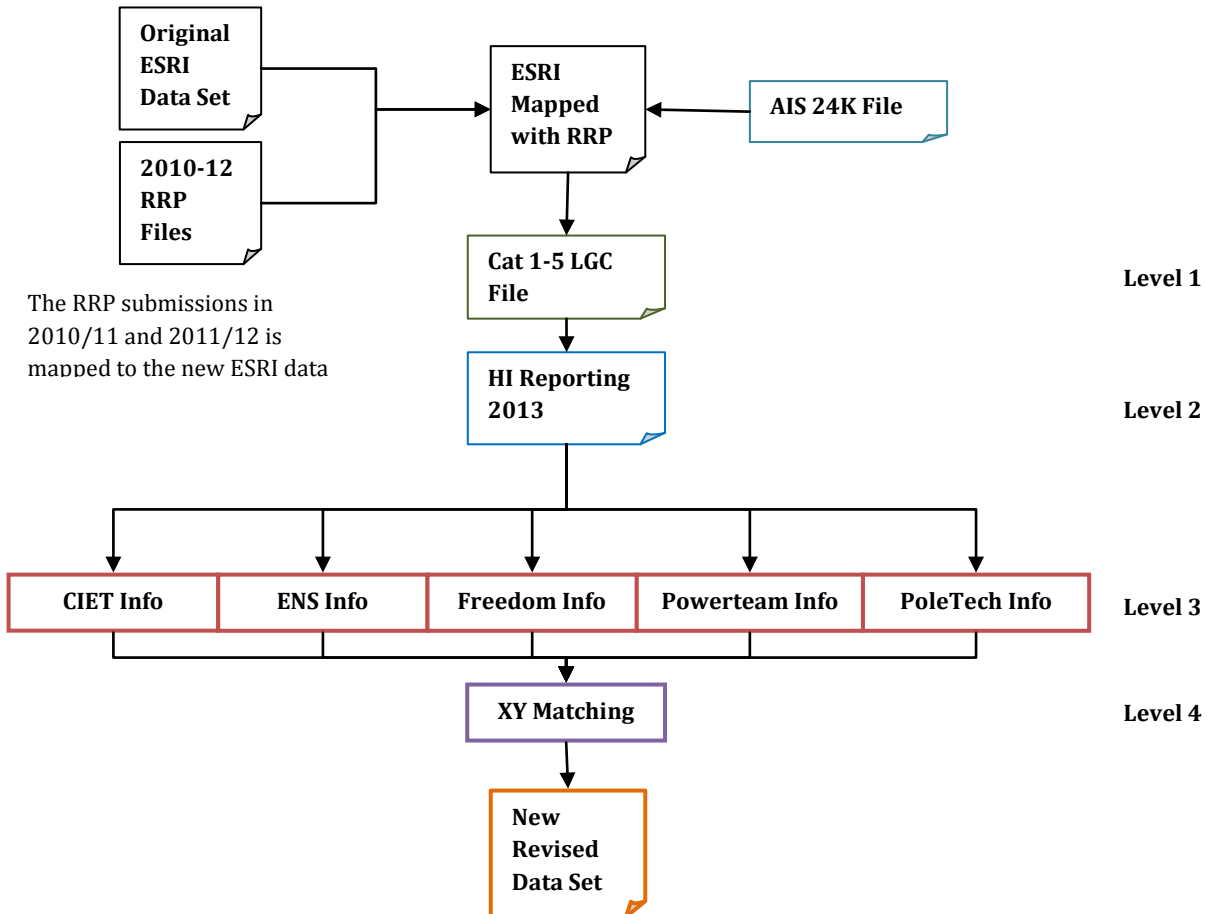

Figure 12 - SPD Poles Database Detailed Linking

Example

Pole disposal is classed as HI0 (unknown) and “Unknown” Asset Activity. The disposal is found in the Cat 1-5 LGC file so for the new profile the pole disposal is set to HI5. Then, in Level 3, the pole is found in the Powerteam data set with a HI3

(based on Age of pole only). The HI of this disposal would remain a HI5 but now the pole would be classed as “Asset Replacement” and therefore count towards HI outputs as this is based on “Asset Replacement” poles only.

New Revised Data Set

The new revised data set is exported to excel to carry out some checks and add “Missing Disposals”. These are poles which have been identified by contractors and programme managers as having been disposed pre-April 2013 but have not been put through our IT system yet. These will be processed this year. The table shown below summarises the missing disposals for SPD. For each of these disposals, the ENID number has been identified.

	Source	Description	No. Of Poles
SPD	HI2013	OHL Manager HI Tracking Sheet for 2013	245
	Freedom	From Freedom's LV tracking sheets, indicating ENIDs of pole replacements in 2011 and 2012	213
	Powerteam	From Powerteams completed LV work pdf's in 2012	113
	CIET	From CIET database where CIET have surveyed the pole as rotten and that the work had been completed	152
		TOTAL	723

Figure 13 – SPD Missing Disposals

From this final data set, the spread of the HI0 across HI1 to HI5 (described on page 2) takes place and all produce the output % tables and graphs that are shown in the following section and appendices. This final data set is also used to complete all the RRP tables (see Appendix 3) and HI tracking workbooks.

RRP 2012/13 Submission – Final Tables

After deliberating numerous methods, SP have decided not to restate any previous submission. The 2012/13 submission will be produced from the poles database, utilising all the possible sources of information to maximise the 2012/13 return to OFGEM.

To provide this view, all sources are selected in the database and the new HI methodology is selected. Also “Fix 2010/11 & 2011/12” option is selected, which means that poles previously reported will not be adjusted in any way. All other poles will be shown in the 2012/13 table.

The full detail of this option is shown in Appendix 1. The top tables show what has previously been submitted for the first 2 years of DPCR5 plus a 2012/13 table based on IT data only (ESRI) and the new HI methodology. This shows that we would be at 8.02% for the first 3 years of D5. This is based on the 100% being the total SPD HI outputs across all categories, not just wooden poles. Wooden poles makes up 22.3% of SPD HI outputs, so this would mean we have completed $8.02/22.3 = 36\%$ of our wooden pole outputs after 60% of the time in DPCR5.

The second set of tables shows the revised position. The figures for the first 2 years of DPCR5 do not change as we are not restating our position. The 2012/13 table shows the revised movements from the pole database. This table indicates we have completed 11.19% of HI outputs which is below the 12.9% we indicated to OFGEM in January and below a straight line view of DPCR5 outputs of 13.4%.

Full Restated DPCR5 Position (New HI Methodology for 2012-13 Only)

If SP had decided to provide OFGEM with a full restated position, SPD would have completed circa 14.17% of HI outputs. This is based on amending the HI or Asset Activity of a pole movement based on all the sources described in this document. This could further be increased to 14.90% if we carried a similar adjustment to 2010/11 as we did for the 2010/11 RRP submission, where we moved disposals from the Asset Activity “Unknown” to Asset Replacement to match the additions.

Summary

The graph below shows the HI outputs for IT, the 2012/13 Submission (2 years of previous RRP submissions plus option discussed above) and the potential of a full DPCR5 restatement (with additional HI for the 2010/11 adjustment). The red line indicates the target for end of 2012/13 submitted to OFGEM in January 2013.

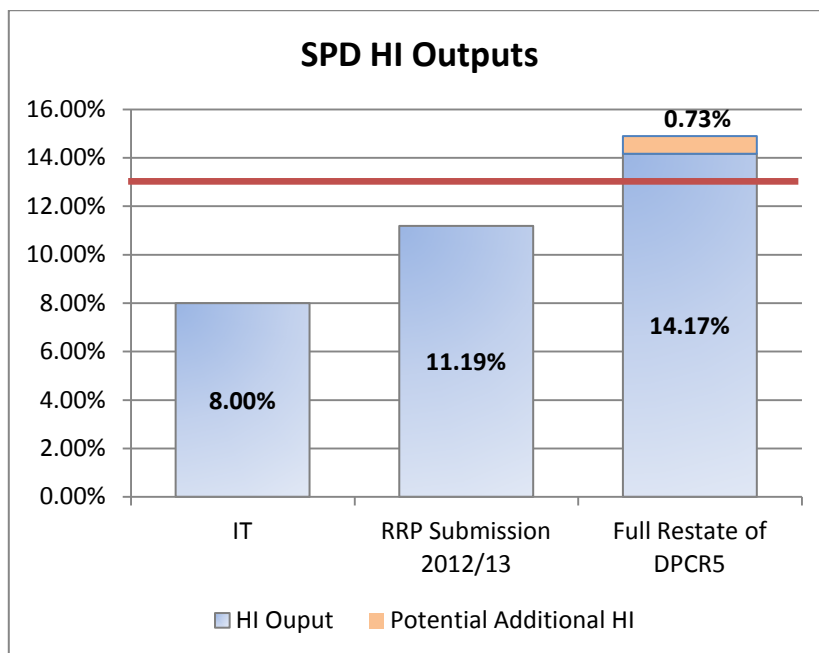

Figure 14 – SPD Poles Summary – Options v 12.9% Target

SP Manweb

This SP Manweb section follows the same principles and methodology as described in SP Distribution. Therefore only updated tables/figures and any exceptions will be shown.

Figure 15 – 2010/11 SPM RRP Adjustments

As this was a high level adjustment, when we take a single pole from the 2010/11 submission, it is difficult to determine what category it was reported as in the submission. For example the table above shows 3383 LV pole disposals were assigned as Asset Activity of Unknown; however, over two thousand of them have been reported as Asset Replacement.

All the poles in the 2010/11 submission file are located in the live ESRI file except 75 poles that appear in SAP but not in ESRI. 72 of these were reported in the 2010/11 RRP as Data Cleanse. The remaining 3 were against Asset Replacement and Demand connections. The 2010/11 detailed file used in the Poles Database has been updated to mirror the above adjustments, as well as the HI outputs position submitted to OGFEM. The outputs position after the first year of DPCR5 is shown on the following page. This is based on the accumulative HI position for each value (additions and disposals), reported against Asset Replacement only. How the HI0's were spread is explained in the first section. The % outputs shown are for the SP Manweb total across all HI output categories. In SPM, Poles makes up 11.22% of the total DPCR5 outputs. Therefore the 0.78% shown is comparable to a straight line 5 year delivery of 2.24% per annum. Thus this indicates around 1/3 of outputs delivered in 2010/11 against D5 settlement for wooden poles.

Figure 17 – 2011/12 SPM RRP HI Outputs

This indicates that we reported only 2 HI5 pole disposals as part of the 2011/12 submission. In fact when we look at the current ESRI data set for 2011/12 (shown below) we can see that the live ESRI data shows over 650 HI5 poles were disposed in 2011/12. Therefore there was an error in the HI tables for the 2011/12 submission.

Figure 18 – 2011/12 Re-run HI Outputs

This will be taken into consideration when discussing the options for the 2012/13 RRP submission later on in this document.

RRP 2012/13

Sources of Information

The following pages describe sources of information that can be used to justify a revised HI position for wooden poles. These sources will then be combined to provide a new HI position for SP Distribution.

Category 1-5 Low Ground Clearances

As part of SP’s work on removing all Low Ground Clearances on our network, any pole change associated with an LGC is assigned HI5. Although this is not picked up in our ESRI system, we have the original list of circa 80,000 LGC’s in SP Manweb that is from our SAP system and is by ENID number (this is the unique reference number for an asset used in both SAP and ESRI). We can then compare this list with our live ESRI data set and adjust the HI for any matching pole disposal to a HI5. This does not affect the Asset Activity code for the disposal.

Contractor Information

CIET

CIET have provided a list of rotten pole replacements from 2011 onwards and this has been matched to the live ESRI data file. Where a match has been found, this pole disposal has been assigned a HI5 and the Asset Activity set to “Asset Replacement”.

Freedom

Freedom provided the original replacement pole lists for any HV and EHV project. Using the pole information such as pole number and GPS readings, we were able to match these lists to pole ENID numbers in UMV. This allowed us to use the live ESRI data file to try and find any matching additions and disposals. Any matching disposal was assigned a HI5 and the Asset Activity set to “Asset Replacement”.

ENS, Powerteam and Poletech

In SP Manweb we have not used any information from these contractors.

SPM Poles Database

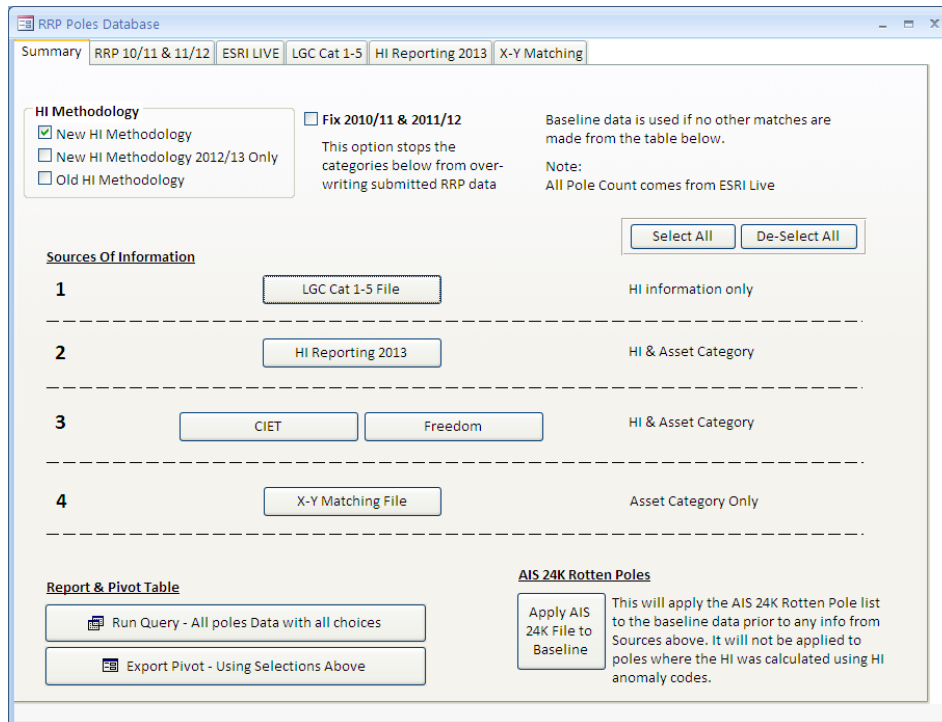

Figure 19 – SPM Poles Database Main Menu

New HI Outputs Position

The diagram shown below illustrates how all the different information is linked and the priorities used when applying data sets to the source data set. Different options can be selected for how the previously submitted RRP data is treated but for example, if we selected to ignore previously submitted data and apply the new HI methodology for a pole, then the pole disposal would first be checked if it is in the Cat 1-5 LGC file (Level 1). If it is, the HI of the pole would be set to HI5. We would then move on to Level 2, the HI Reporting 2013 file. If the pole is matched, the HI and Asset Activity would be set based on this file, but the HI would only use the Level 2 HI if it did not match at Level 1. Then the pole is checked at Level 3, the contractor information. If matched at this level, the pole HI and Asset Activity would be set based on the contractor info. Similar, any matches at a higher level would prevent a match from a lower level. The pole is then checked at Level 4, XY matching. This will not affect the HI of the pole but would re-class the pole as “Asset Replacement” where matched. For more information on how the different sources operate, refer back to earlier in this document.

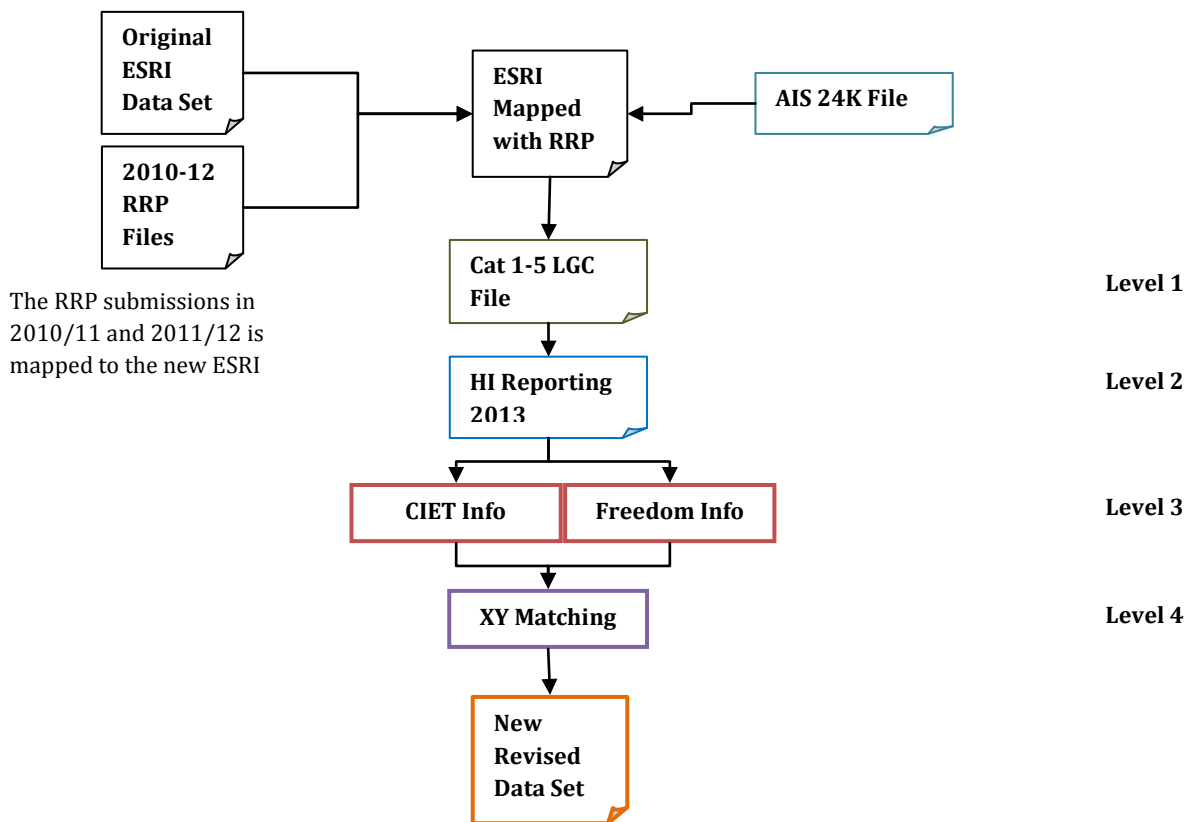

Figure 20 – SPM Poles Database Detailed Linking

Example

Pole disposal is classed as HI0 (unknown) and “Unknown” Asset Activity. The disposal is found in the Cat 1-5 LGC file so for the new profile the pole disposal is set to HI5. Then, in Level 3, the pole is found in the Freedom data set with a HI5. The HI of this disposal would remain a HI5 but now the pole would be classed as “Asset Replacement” and therefore count towards HI outputs as this is based on “Asset Replacement” poles only.

New Revised Data Set

	Source	Description	No. Of Poles
SPM	HI2013	OHL Manager HI Tracking Sheet for 2013	811
	Freedom	Freedom's provided list of pole replacements (discounting those that were marked as incomplete (yellow))	356
	CIET	CIET's provided lists of pole replacements	24
TOTAL			1191

Figure 21 – SPM Missing Disposals

RRP 2012/13 Submission – Final Tables

The full detail of this option is shown in Appendix 2. The top tables show what has previously been submitted for the first 2 years of DPCR5 plus a 2012/13 table based on IT data only (ESRI) and the new HI methodology. This shows that we would be at 4.37% for the first 3 years of D5. This is based on the 100% being the total SPM HI outputs across all categories, not just wooden poles. Wooden poles makes up 11.22% of SPM HI outputs, so this would mean we have completed $4.37/11.22 = 38.9\%$ of our wooden pole outputs after 60% of the time in DPCR5.

The second set of tables shows the revised position. The figures for the first 2 years of DPCR5 do not change as we are not restating our position. The 2012/13 table shows the revised movements from the pole database. This table indicates we have completed 6.60% of HI outputs which is above the 5.9% we indicated to OFGEM in January and below a straight line view of DPCR5 outputs of 6.7%.

Full Restated DPCR5 Position (New HI Methodology for 2012-13 Only)

If SP had decided to provide OFGEM with a full restated position, SPM would have completed circa 8.96% of HI outputs. This is based on amending the HI or Asset Activity of a pole movement based on all the sources described in this document. This could further be increased to 9.47% if we carried a similar adjustment to 2010/11 as we did for the 2010/11 RRP submission, where we moved disposals from the Asset Activity “Unknown” to Asset Replacement to match the additions.

Summary

The graph below shows the HI outputs for IT, the 2012/13 Submission (2 years of previous RRP submissions plus option discussed above) and the potential of a full DPCR5 restatement (with additional HI for the 2010/11 adjustment). The red line indicates the target for end of 2012/13 submitted to OFGEM in January 2013.

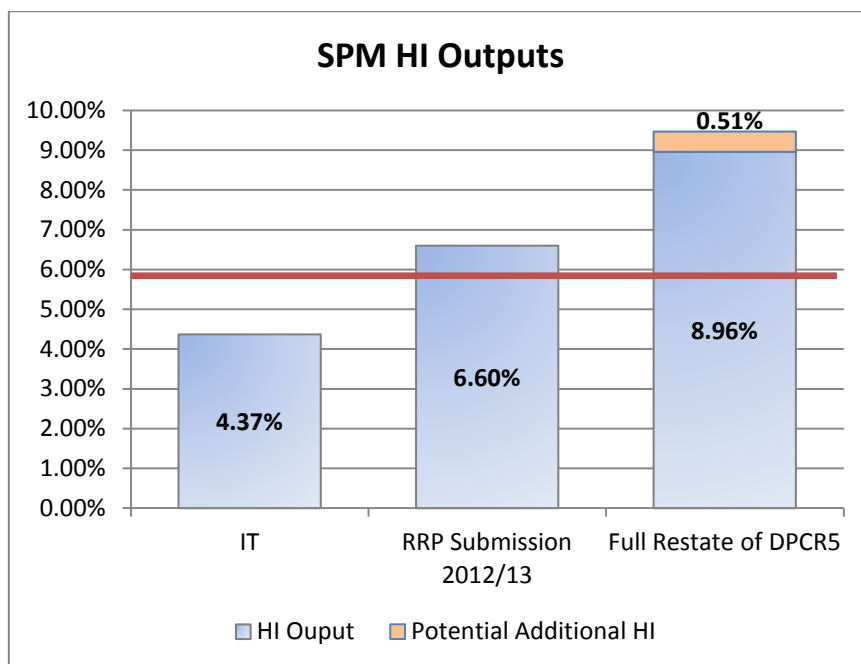

Figure 22 – SPM Poles Summary – Options v 5.9% Target

RRP Tables

Appendix 3 shows the final movement numbers that will be used to complete the 2012/13 RRP submission. The tables show the additions and disposals against each of the delivery areas, and a reference to the RRP tables is shown in red underneath each column. The data cleanse column is superseded by the highlighted yellow data cleanse column. This is due the work being undertaken by the data improvement project which has been looking at our total asset population in our corporate systems. The new closing balance is then calculated from our IT system and then the missing disposals are subtracted from the total. The data cleanse column is then adjusted so that the closing balance in the RRP submission is equal to our IT system minus the missing disposals.

HI Tracking Workbook

Appendix 4 shows the final HI Tracking workbooks for wood poles. The “Variance due to Material Changes” line has been used to balance the closing balance so that it matches our IT system minus the missing disposals. The large variance shown in this line is due to our change in HI methodology as described at the beginning of this document. For “Asset register movements for other investment” and “Impact on volumes of data cleansing (before Material Changes)” where the HI is not known, it has been determined using the same methodology described at the beginning of this document.

Summary Position

Appendix 5 shows the pole movements for RRP 2012/13 along with the pole movements for a full DPCR5 restatement.

EHV	478	-4	-503	0	0	0.45%
						1.84%

* Data Set from ESRI but error on HIS info
* Based on Old HI Methodology

	New Profile Apr 2012 -> Mar 2013					
	1	2	3	4	5	% Outputs
LV	1559	-18	-43	-62	-2054	3.13%
HV	2313	-119	-176	-309	-2111	4.21%
EHV	173	-4	-29	-51	-174	0.66%
						8.00%

* Based on New HI Methodology
* Contains missing disposals

D5 TOTAL
11.19%

3. Full 3 year re-statement using all sources of information (contractor CBA's etc)

	New Profile 2010/11					
	1	2	3	4	5	% Outputs
LV	1109	-28	-95	-88	-664	1.11%
HV	948	-57	-186	-22	-333	0.71%
EHV	112	-2	-54	0	-20	0.11%
						1.93%

* Based on Old HI Methodology

	New Profile 2011/12					
	1	2	3	4	5	% Outputs
LV	1150	-10	-51	-32	-1400	2.13%
HV	1197	-70	-271	-99	-668	1.45%
EHV	484	-4	-423	0	-90	0.65%
						4.23%

* Based on Old HI Methodology

	New Profile Apr 2012 -> Mar 2013					
	1	2	3	4	5	% Outputs
LV	1559	-18	-43	-62	-2054	3.13%
HV	2313	-119	-176	-309	-2111	4.21%
EHV	173	-4	-29	-51	-174	0.66%
						8.00%

* Based on New HI Methodology
* Contains missing disposals

D5 TOTAL
14.17%

** This could potentially rise to 14.90% if we apply same logic as we did in 2010/11 submission. This would mean increasing the number of disposals to match the additions

Summary

Option 1-3 shows % of SPD outputs for HI

Option 4 is Option 3 with the adjustment to 2010/11 figures (matching additions numbers with disposals)

Target indicated to OFGEM in Jan 2013 was 12.9%
