

Beauly to Denny Overhead line upgrade and the new Denny North 275/400kV Substation

Progress Update Winter 2015/2016

Overhead line

The 400/275kV overhead line network was energised in November 2015. Although the main deliverable has now been achieved, work continues on the project, including the undergrounding of some 132kV circuits in the Stirling area which will allow 50 transmission towers to be removed. Other visual mitigation measures to minimise the impact of the new overhead line on local communities and residents will continue.

Denny North 275/400kV Substation

The majority of the work is now complete. The 300 tonne Transformer has been installed. The 275kV substation was energised in August 2014 and the 400kV substation energised November 2015. Work will continue through to the final completion mid-2016.
